Ossia v1.4.5 FW version release info

1. HTTP Live Streaming

Starting with this version, the notorious plug-in is no longer needed. You no longer need to use IE! Feel free to choose any major internet browser in its latest version (Chrome, Firefox, Safari Etc.) Using Fish-Eye cameras will still require IE with plug-in since HTML video cannot perform dewarping modes.

2. Improved remote web client

The lack of the Plug-In has "unleashed" the capabilities of the web client.
The new web client now features the following improvements:

2.1. Fully functional analytics bar (similar to the local interface) from which the user can search, playback, and add objects to the databases.

2.2. Add a combination of characters (both letters and digits) in the dedicated field.

The system will capture all the plates characterized by the selected combination of characters and show the related events on the time bar.

2.3. Playback now has "Advanced Analytics" search capabilities!

3. P2P Secured connection to the Provision Cam2 mobile App (v1.8.0):

Starting from v1.4.5, there could be only one device owner (Admin). The device owner will be the only one able to share the device with others, thus having complete control of who can connect to the device using the Mobile App.

4. ONVIF G/T Support *

This version is ONVIF compatible, meaning that you can connect the NVRs to professional VMS that supports ONVIF protocol and get live view, alarms, audio, and playback.

5. New PTZ Series Support *

The new version will support the new features offered by our new PTZ line, such as DDA auto-tracking.

6. Alarm out mode selection

From now on, the user can choose if the NVR integral alarm out will work in NC or NO mode.

7. Scheduled Object Counting report

Object counting channels can now send daily/weekly/monthly reports of the counting statistics.

8. IPv6 support

From now on, it is possible to add a camera to an NVR using the camera's IPv6 address.
Please update to v1.4.4 from the latest FW available for your device.

9. DDNS status

The system shows an indication of the DDNS connection status.

10. Separated RTSP

The RTSP feature is now detached from the API section, and unlike before, can be activated remotely.

11. NTFS support

USB disks formatted to the NTFS file system will now be supported and readable by the NVR.

- All settings will be saved after the update.

Experience the new and improved OSSIA 1.4.5 Version!

Best Regards,
Provision-ISR Technical team
